# Condor
Embedded Processing Unit

95 x 95 x 37 mm
(3.7 x 3.7 x 1.5")

Overview

The Condor is a compact, high-performance, embedded computer. It has been engineered and tested to meet evolving requirements for smaller, lighter, and lower power embedded systems while adhering to stringent regulatory standards. Designed around the COM "compact" form factor, the Condor is a member of the VersaLogic "EPU" family of ultra-rugged embedded computers, designed to withstand extreme temperature, impact, and vibration.

The Condor's on-board TPM security chip can lock out unauthorized hardware and software access. It provides a secure "Root of Trust." Additional security is provided through built-in AES (Advanced Encryption Standard) instructions.

The Condor features high-performance Skylake processors with dual-core CPUs and Hyper-Threading logic, allowing up to 4 simultaneous threads to be executed. Even with its outstanding performance and I/O features, the Condor's typical power consumption is 15 to 17 watts, depending on the model. The Condor provides compatibility with a broad range of standard x86 application development tools for reduced development time.

Condor's on-board Power Management Unit greatly simplifies system power supply requirements. It features a wide input voltage
